

Data Structures - Previous Year Question Paper

Q1. Define a binary search tree and state its ordering property. (5 marks)

Q2. Explain the time complexity of search in a balanced versus a skewed binary search tree. (5 marks)

Q3. What is an AVL tree? Describe how rotations keep it balanced after an insertion. (10 marks)

Q4. Write the in-order, pre-order, and post-order traversal of a given binary tree and explain how level-order traversal differs. (10 marks)
